Repository Information

Repository's URL: <https://github.com/cdoggxx-uc/waph-monaghcn.git>

Labs

Hands-on exercises in lectures

- Lab 0: Development Environment Setup
- Lab1: Foundations of the Web
- Lab2: Front-end Web Development
- Hackathon 1: Hackathon 1
- Individual Project 1: Individual Project 1

Lab Overview:

This individual project is a public portfolio designed to showcase my skills and experience to potential employers. In addition to serving as my resume, this repository meets course requirements by including interactive scripts we learned in previous labs.

General requirements

For the general requirements task, we had to create and deploy a personal website on github.io that includes our resume, name, headshot, contact info and background. I did this by uploading a bootstrap template to github.io and filling in the information above. To publish the website, I put the code in a github repository named cdoggxx-uc.github.io. Now, I can go to the link and view the website. I added a new button that takes the user to a new HTML page called WebClass.html. This page introduces this course and related hands on projects.

Non-technical requirements

To meet the non-technical requirements, I used a bootstrap resume template called “Personal”. I then used a tracker provided by google api to track all visits to my page. To do this, I had to include a script at the top of my page, and link it to my google account.

Technical requirements

For this task, I included the following:

- jokeAPI
- analog clock
- XKCD API
- WeatherStack API
- A digital clock
- show/hide your email functionality
- JavaScript cookies to remember the client
